In this assignment, class selectors like content box and editorial-text were very useful.

They allowed me to create clean, reusable styles applied across multiple HTML elements without repeating code a lot. Learning about box models has changed my layout. The padding handles internal spacing giving text some breathing room while margins controls external spacing keeping different things organized. Using box sizing: border box was critical because it kept my container sizes predictable when adding padding and borders.

I encountered a clear style override situation when managing my elements. Initially, I had duplicate body selectors and global paragraph styles setting text properties. When I introduced a descendant selector like content-box p, it successfully overrode the global rules to apply clean, clear text inside my styled container blocks while leaving other text alone.

All- together, cleaning up my redundant code blocks and moving styling out of the body tag into dedicated utility classes most improved my website to really make it clean.it transformed my layout into a well- organized page for a good user experience.

The most significant layout issue I discovered was how the colors mixed with my page background, in the text format I changed it so it would hopefully become more accessible to all readers who visit the website. I used the color change and in my css to fix the issue by changing it to a much darker color that still fit the deign of the webpage. The page was all well and good at each view point behaving like most browser pages on mobile I was perfectly able to view the website. No matter which viewpoint I used for the website my page appeared clearly with only minimal changes with the different views. Which satisfied my curiosity and hopefully makes it easy for all web surfers to view my page with enthusiasm. I learned new skills that I can use when making other websites to use so that when I do so I know just when and how to use CSS elements in a good enough way that my page is presentable and able to be viewed by its web audience. I'm unsure which improvements I would make completely but I believe my website fits the basic needs for a beginner website. To make improvements I would think to maybe add more images maybe a more decent design that goes in the background if I can do it well and learn to do it correctly. I enjoy web building and wish to learn other aspects that can help me become good at website building and coding in a way that suits my style.
